Nucleotide Sequences and Deduced PapH Primary Structures

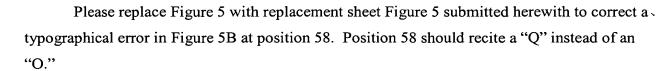

The plasmids pHUR849 (pap-5), pDAL201B (pap-21), pDAL210B (pap-17) and, pDAL200A (pap-200A), in E coli strain HB101 express digalactose-binding of the serotypes F13, F7₁, F7₂ and F9, respectively. The pap gene cluster responsible for regulation and biogenesis of these pili from E. coli strains J96, C1212 and, 3669 is 1U. diagrammed in FIG. 1. Sequence analysis of papH genes from pDAL201B (pap-21), pDAL210B (pap-17) and, pDAL200A (pap-200A), was compared to the known nucleotide sequence of papH gene of

b contains a single Sma I blunt end restriction site double underlined.

pHUR849 (pap-5) (3). FIG. 2 shows a single 588-bp open reading frame with the same polarity as papA (2, 4). Analyses of these papH sequences revealed many typical features of prokaryotic gene organization. All four papH gene sequences contained a potential ribosome-binding sites, ATG initiation codon signal sequence, and a TGA termination codon. A potential initiation codon ATG at position -22, preceded by a sequence corresponding to -AGGGT, which showed homology to ribosome-binding sites, was found 13-bp upstream in all four papH sequences. A protein initiated here and ending at the TGA triplet at position 586 would encode a 195 amino acid polypeptide with a calculated molecular weight of 21.9 kd. The mature PapH protein contains 173 amino acid residues. The NH2-terminal amino acid sequence of the open reading frame has all the features of a signal peptide sequence. The deduced putative signal sequence for the papH was located 22 codons upstream of their terminal Ala (FIG. 2). These sequences contained a highly hydrophobic region comprising an amino acids stretch of Ser-Val-Pro-Leu-Phe-Phe-Phe (residues -17 to -11 of SRQ ID NO: 32). There was a positively charge amino acid residue (Arg) at the position -21. The suggested cleavage sites between Ala -1 and gly +1 conforms to rules of prokaryotic signal cleavage sites and was similar to most other bacterial genes (12). In addition, the final papH deletion derivatives, pKD849-5 (pap-5), pKD201B (pap-21), pKD210B-1 (pap-17) and pKD200A-8\(pap-200A), were also sequenced. In addition, sequencing into the papA and papC genes which flank the papH gene (FIG. 1) of all four papH deletion derivatives was carried out in order to insure that all three genes were in frame. Finally, the codon usage of the papH genes of pDAL20\(\)B, pDAL210B and, pDAL200A, and papH gene of pHUR849 were analyzed using a codon frequency computer program (13). The pattern of codon utilization was not significantly different among the genes.

In the Figures:

In the Claims:

1. (Presently Amended) An immunogenic composition comprising dissociated pili from a α-D-Galp-(1-4)-β-D-Galp (Gal-Gal) binding pilus-producing Escherichia coli bacteria, said pili comprising at least one immunogenic peptide inserted into the immunodominant region
